■ ZIMI TV — HOSTING & SETUP GUIDE

Complete Setup: GitHub ➔ Railway.app ➔ Telegram Bot ➔ Firebase RTDB ➔ Adsgram (Block 52491)

Project Summary: Zimi TV is a high-speed Telegram Mini App (TMA) and video streaming platform. It features an automatic multi-channel video poster, a 4-channel membership lock, real-time Firebase sync, and Adsgram rewarded ads monetization.

STEP 1: Push Code to GitHub & Deploy on Railway

1. **Create a GitHub Repo:** Create a new Public or Private repository on GitHub (e.g., zimi-tv).
2. **Push the Code:** Open the project folder in terminal and push:
   git remote add origin https://github.com/USERNAME/REPO.git
   git push -u origin master
3. **Deploy on Railway:** Go to **https://railway.app** ➔ Login ➔ Click **New Project** ➔ Select **Deploy from GitHub repo** ➔ Select your repository.
4. **Generate Domain:** In your Railway service ➔ Go to **Settings** tab ➔ Scroll down to **Networking** ➔ Click **Generate Domain**. You will get a free HTTPS link (e.g., https://zimitv-production.up.railway.app).

STEP 2: Railway Environment Variables (Variables Tab)

Go to your Railway service ➔ Click on the **Variables** tab ➔ Add these exact keys & values:

Variable Name	Exact Value to Enter	Purpose & Description
`BOT_TOKEN`	Your token from @BotFather	Controls the Telegram Mini App & auto-poster bot.
`PORT`	`5000`	Internal port for the Express backend server.
`POST_CHANNELS`	`@newhotcontent2026,@hotvideooo2026,@hotvideoo2026,@seemahotveet`	Comma-separated list of 4 channels where unique videos will be auto-posted every 15 minutes.
`POST_INTERVAL_MINUTES`	`15`	How often (in minutes) the bot posts new videos to channels.
`WEB_APP_URL`	`https://your-domain.up.railway.app`	The public HTTPS URL generated in Railway Networking settings.
`FIREBASE_DATABASE_URL`	`https://zimitv-62421-default-rtdb.firebaseio.com`	Your Firebase Realtime Database for users, bookmarks & settings.
`BOT_USERNAME`	your_bot_username (without @)	Used to generate direct deep-links on video posts.
`API_SECRET_KEY`	`zimitv_secret_key_2026`	Internal security token between frontend & backend.

STEP 3: Telegram Channels & Admin Setup

Make sure to add your Bot as an **ADMINISTRATOR** in all 4 target channels:
• **Channel 1:** https://t.me/newhotcontent2026 (@newhotcontent2026)
• **Channel 2:** https://t.me/hotvideooo2026 (@hotvideooo2026)
• **Channel 3:** https://t.me/hotvideoo2026 (@hotvideoo2026)
• **Channel 4:** https://t.me/seemahotveet (@seemahotveet)
Required Admin Rights: *Post Messages* (to post videos) and *Add/Invite Users* (to verify membership lock).

STEP 4: Dual Channel Redundancy (Fail-Safe Architecture)

■■ Zero-Downtime Redundancy:
The 4 channels have already been pre-saved directly into your Firebase Realtime Database (/bot_settings.json) AND in the code/env defaults.
• If Railway environment variables are set ➔ Bot uses Railway env.
• If Railway env is empty ➔ Bot seamlessly reads from Firebase.
• If Firebase has network latency ➔ Bot falls back to hardcoded defaults.
Result: The auto-poster and force-sub channel lock will NEVER stop working!

STEP 5: Admin Control Panel (admin.html)

You can manage your entire Mini App directly using **admin.html** (included in the root and public directory):
1. Simply open admin.html in any web browser.
2. It connects directly to your Firebase database (https://zimitv-62421-default-rtdb.firebaseio.com).
3. You can dynamically add/edit channels, send global Telegram broadcasts, view live user stats, and block/unblock users.

STEP 6: Adsgram Rewarded Ads (Block ID: 52491)

• **Pre-Configured:** Adsgram SDK is already integrated with your Ad Block ID: 52491.
• **User Reward Flow:** When a user's free watch time expires, they click *'Watch Quick Ad (+1 Min)'* ➔ Adsgram video plays ➔ +60s watch time is added automatically.
• **Earnings:** All ad revenue automatically credits to your account on **https://adsgram.ai**.
